Have you ever tried adding GitHub webhook in Jenkins? In this blog, I will be demonstrating the easiest way to add a webhook in your pipeline.

First, what is a webhook? The concept of a webhook is simple. A webhook is an HTTP callback, an HTTP POST that occurs when something happens through a simple event-notification via HTTP POST.

GitHub webhooks in Jenkins are used to trigger the build whenever a developer commits something to the master branch.

Let's see how to add build a webhook in GitHub and then add this webhook in Jenkins.

1. Go to your project repository.
2. Go to "settings" in the right corner.
3. Click on "webhooks."
4. Click "Add webhooks."
5. Write the Payload URL as

Options  
Collaborators  
Branches  
**Webhooks**  
Integrations & services  
Deploy keys  
Moderation  
Interaction limits

### Webhooks / Manage webhook

We'll send a POST request to the URL below with details of any subscribed events. You can also specify which data format you'd like to receive (JSON, x-www-form-urlencoded, etc). More information can be found in [our developer documentation](#).

**Payload URL \***

**Content type**

**Secret**

**SSL verification**

By default, we verify SSL certificates when delivering payloads.

☐ Enable SSL verification
 ☒ Disable (not recommended)

**Which events would you like to trigger this webhook?**

☐ Just the push event.  
☒ Send me everything.  
☐ Let me select individual events.

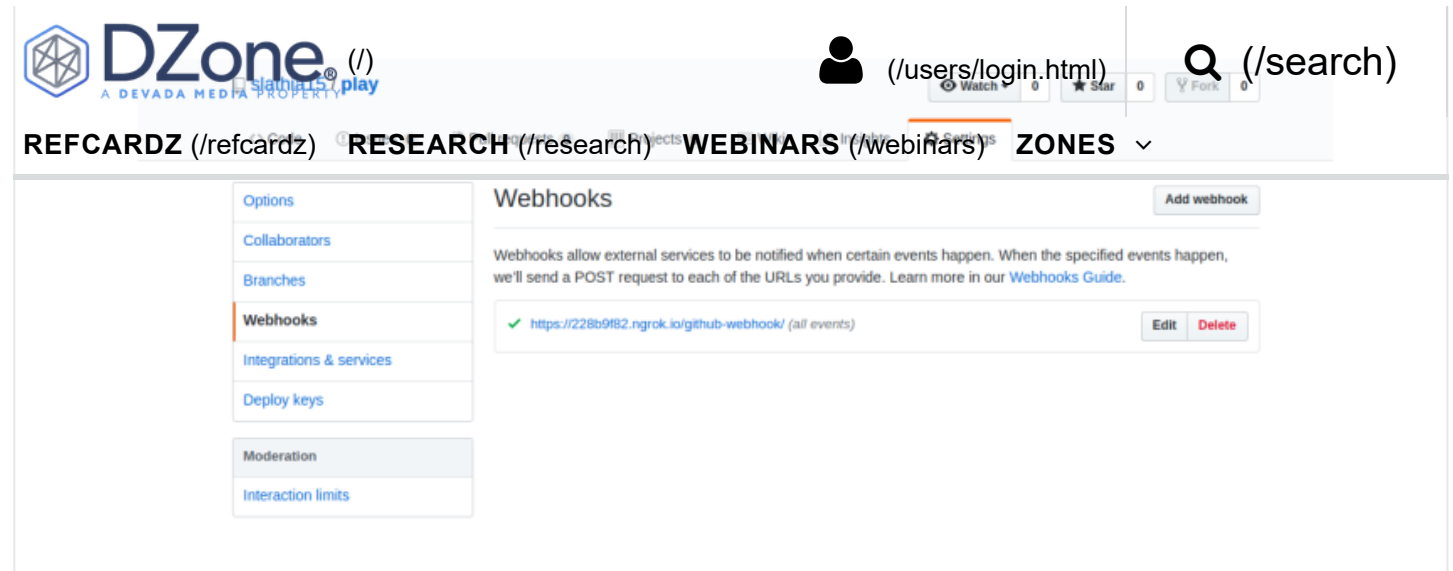

Here, **Payload URL** is the URL where our Jenkins is running add github-webhook to tell GitHub that it is a webhook.

- **Content type:** What kind of data we want in our webhook. I have selected JSON data.
- **Secret:** Used to secure our webhook we can provide a secret in our webhook and ensure that only applications having this webhooks can use it.
- **SSL verification:** This SSL Checker will help you diagnose problems with your SSL certificate installation. You can verify the SSL certificate on your web server to make sure it is correctly installed, valid, trusted and doesn't give any errors to any of your users.

### Which events would you like to trigger this webhook?

1. **Just the push event:** Only send data when someone pushed into my repository.
2. **Send me everything:** If there is any pull or push event in our repository we will get notified.
3. **Let me select individual events:** We can configure for what events we want our data.

Click Create and a webhook will be created.

Here <https://228b9f82.ngrok.io/> is the port or IP where my Jenkins is running.

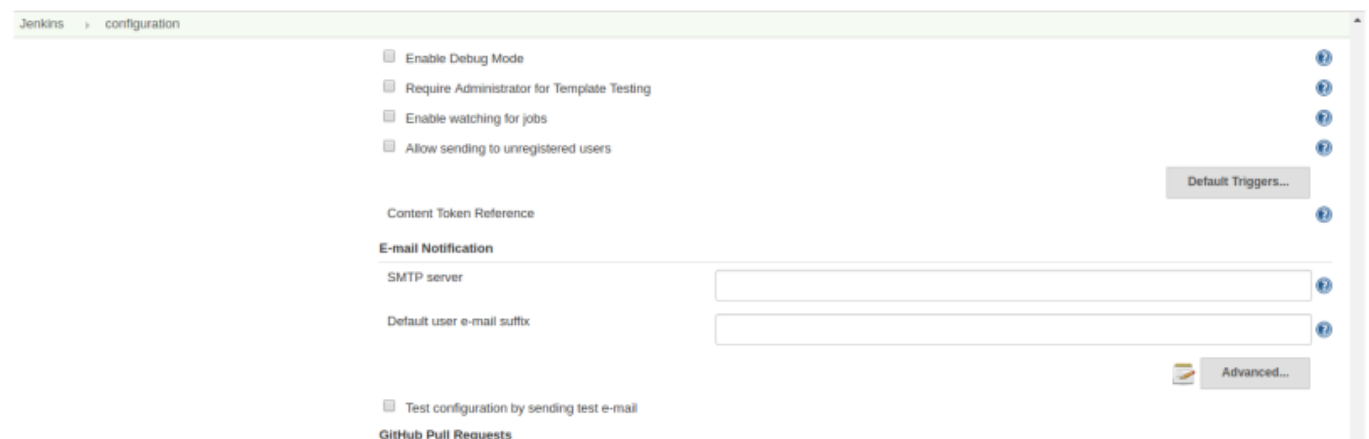

Here is a problem you have to take care of if you are running Jenkins on localhost then writing <https://localhost:8080/github-webhook/> will not work because Webhooks can only work when they are exposed to the internet.

So if you want to make your localhost:8080 expose to the internet then we can use tool

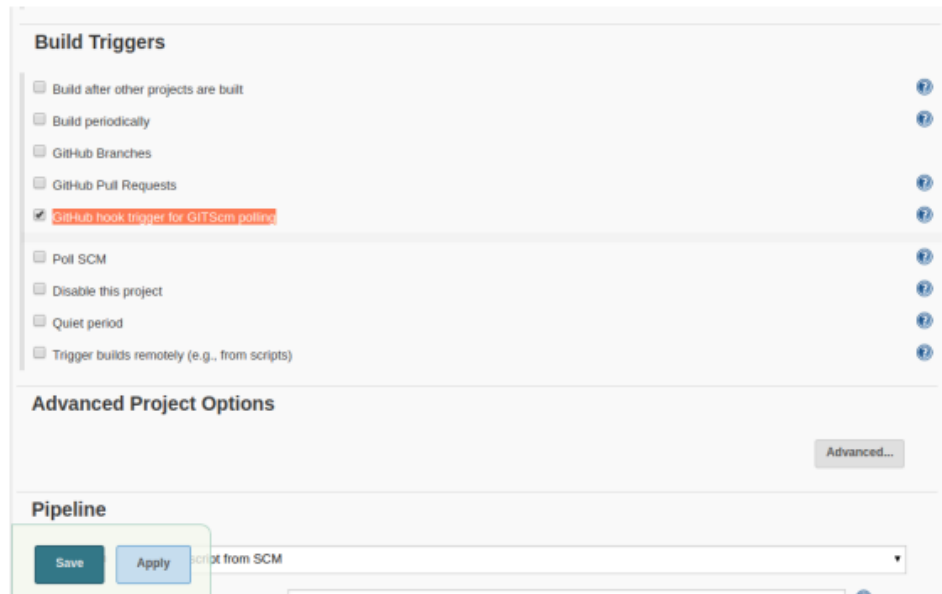

Write GitHub-webhook to the ngrok tool refer to [this link](https://ngrok.com/download) (<https://ngrok.com/download>).

Now let's see how to use this webhook in Jenkins.

1. Go to Manage Jenkins -> Configure System
2. Scroll down and you will find the **GitHub Pull Requests** checkbox. In the **Published Jenkins URL**, add the repository link
3. Click on "Save."

Now go to the Jenkins pipeline and select "GitHub hook trigger for GITScm polling."

In this way, we can add a webhook to our job and ensure that everytime a developer commits a code to GitHub, our build will be triggered.

I hope this blog was helpful in adding [GitHub](https://dzone.com/articles/top-10-github-repositories-will-make-your-daypart) (https://dzone.com/articles/top-10-github-repositories-will-make-your-daypart) webhooks in Jenkins.
